

PLANT A POLLINATOR PROGRAM

What is a Pollinator Garden?

It's a garden filled with flowering plants that provide nectar and pollen for pollinators. They can be small or large, in your backyard, balcony, or even a community space. Invasive species affect both pollinating animals and plants, therefore, it is important to plant native plants based on the region where you reside.

Violets & sunflowers

Maple tree

Native lilies

Why are Pollinators Important?

Pollinators like bees, butterflies, and hummingbirds are vital to our planet's health. They help produce one out of every three bites of food we eat! But their populations are declining due to habitat loss and pesticide use.

Benefits of a Pollinator Garden:

- Supports pollinators: Provides food and shelter, helping their populations thrive.
- Beautifies your space: Vibrant flowers add color and life to your surroundings.
- Boosts local food production: Healthy pollinators lead to better fruit and vegetable yields.
- Creates a natural habitat: Attracts other beneficial insects like ladybugs and butterflies.
- Fun and educational! Learn about plants and pollinators while enjoying nature.

How to Apply for the Program?

Registration is encouraged! To register for this program, scan the QR code:

Which Plants should I Garden?
